## Distance setting laser photoelectric sensor

## F3C-AL

## Features

Clear red spot ensures easy setting.
With its wide setting range 150 to 700 mm , F 3 C -AL is compatible with standard conveyors. In the setting distance of 700 mm , the distance can be set easily with a $1.5 \times 4 \mathrm{~mm}$ red spot.

## Secure detection of shiny surface

Ensures stable detection of a 45 -degree shiny surface. Detection of pouches, laminated packages or like minimizes setup change time.

Unaffected by a shiny background.
Insensitive to shiny objects in the background, the Sensor can be installed in any place.

## Small Black/White error:

1\% (Setting distance 300 mm ), 3\% max. (Setting distance 500 mm )
A little black/white error saves adjustment time during setup change.

Full hysteresis detection range 0.5\% max. (for white paper)

6-turn adjuster ensures ease of adjustment.

## Application

## Ordering Information

Sensors $\quad \square$ Red light

| Shape | Connection method | Sensing/Setting range | Operating mode | Model |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

## Precautions

 cause blindness.

## Laser safety

The laser safeguards have been stipulated for laser equipment in and outside Japan. The following gives brief description for use in Japan.
The JIS C6802 Standard stipulates safety preventives that must be taken by the user according to the laser product class. (The outline is given in the following table.)
User's Requirements

| Item Class | Class 1 | Class 2 | Class 3A | Class 3B |  | Class 4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | 3B* | 3B |  |
| Using remote interlock | Not required |  |  |  | Conne <br> mote <br> the las <br> the <br> main <br> interlock <br> room, <br> lock of | the reerlock of beam to mergency rlock, the of the the interdoor. |
| Key control | Not required |  |  |  | Do n key when beam | keep the the lock laser ot used. |
| Beambreaker or attenuator | Not required |  |  |  | Used people dental the las | protect rom accidiation by beam. |
| Warning sign | Not required |  |  | Post a proper warning sign on the door to the room where laser beam equipment is installed. |  |  |
| Beam path | The laser beam must be terminated and, as a rule, must be enclosed. If the laser beam is exposed, the vertical height of the beam must not be the same as that of the eyes. |  |  |  |  |  |
| Mirror reflection | Not required |  |  | Appropriate optical elements must be securely attached and you must be able to control the optical elements during laser radiation. |  |  |
| Eye protect | Not required |  |  |  | Use ey excep specifi | protectors <br> special, locations. |
| Protection clothes | Not required |  | Wear protection clothes if exposure of the skin to the laser beam may exceed the MPE of the skin. |  |  |  |
| Training | Not required |  | The laser system must be operated by only properly trained people. |  |  |  |

* 5 mW or less in the visible range

## Classification of F3C

## Class 2

Handle laser equipment in accordance with the following precautions.

- Do not look into the beam.
- Do not disassemble the product. Doing so will release the laser beam to wander around.
Please obtain or prepare the "Laser product safety standards" on your own responsibility.

## Labels related to laser

The following warning label is applied to the side face of the photoelectric sensor.

For use in Japan, change the above label for the one that meets the JIS Standards.

Handling Instructions
F3C radiates a visible-light laser. Do not look into it directly. Use F3C so that the light path of the laser beam is terminated. If there is a mirror-smooth reflector in the light path, confine the beam away from the reflected light path. If F3C must be used with the light path open, avoid placing the light path on the eye level.

## Correct Use

## Design

## Power Reset Time

The Photoelectric Sensor is ready to sense an object in 300 ms after power-on. Therefore, use it 300 ms after power-on. If the load and Sensor are connected to different power supplies, always switch on power for the Sensor first.

## Wiring Considerations

## Load short-circuit protection

- The F3C-AL has load short-circuit protection. If a load shortcircuit or like has occurred, the output turns OFF. Therefore, recheck the wiring and switch power on again. This resets the short-circuit protection circuit. Load short-circuit protection is activated when a current of 1.8 times or more of the rated load current flows. When using an $L$ load, use the one the inrush current of which is less than 1.8 times of the rated load current.
- Do not use the input power exceeding the rated voltage. Doing so can cause damage.
- Do not shorten the load with the open collector output. Otherwise, damage might be caused.
- Run the wiring of F3C separately from the high voltage and power cables.
- Avoid wiring them together or running them within the same duct. Doing so may get them induced, causing a malfunction or damage.
- For extension of the cable, use a $0.3-\mathrm{mm}^{2}$ or more cable and run it within 50 m .

## Mounting

- Install the photoelectric sensor so that the sun, fluorescent lamp, incandescent lamp or any other strong light will not enter the directional angle range of the sensor.
- If Sensors are installed face-to-face, ensure that no optical axes cross each other. Otherwise, mutual interference may result.
- Use M4 screws to mount the unit.
- When mounting the case tighten it to the torque of 1.2 Nm max.

## Miscellaneous

## Operating Environment

- Avoid using the Sensor in a strong disturbance light (e.g. laser beam or arc welding beam) or strong electromagnetic field.
- Depending on their material and/or shape, some objects may not be detected or may be detected with low accuracy. (Mirror-smooth material, transparent material, material of extremely low reflectivity, object smaller than spot diameter)
