PICO-IMX6UL Android Things

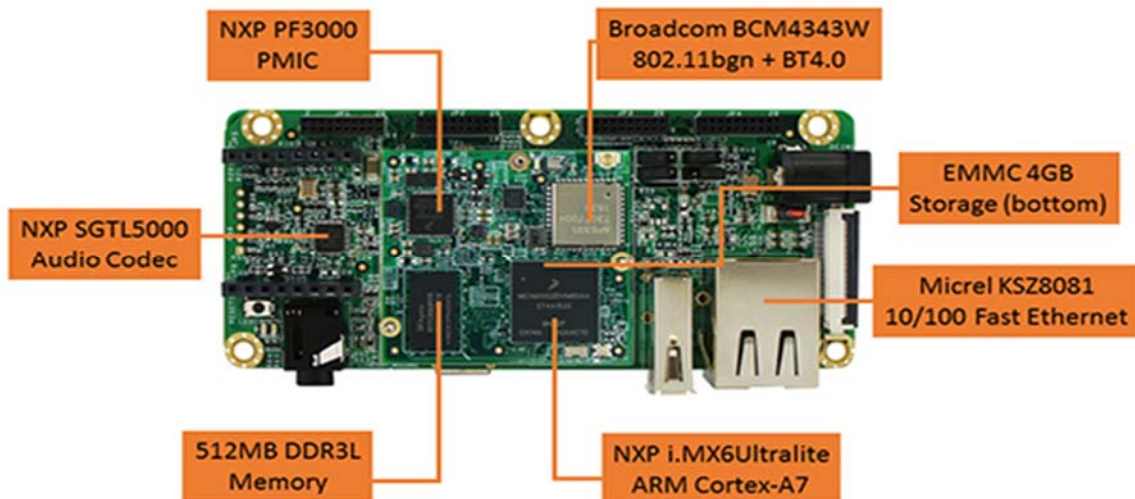

Android Things is a new version of Android aimed at enabling faster development of secure connected devices for the Internet of Things (IoT). Android Things is a lightweight embedded OS that includes Weave, a communication protocol that enables both local and cloud connectivity over multiple wireless protocols. Android Things delivers security at the scale you need it via Google-managed updates and verified boot.

To enable Android Things Wandboard developed the **PICO-IMX6UL-KIT** and worked very closely with Google and NXP to help engineers and makers with a predictable development track and extrem short time to market at low unit costs.

We are very excited that the **PICO-IMX6UL** is one of the first boards available that is proud to carry the Android Things Logo.

Development Kit Overview
