## RMPA0959

## CDMA and CDMA2000－1X PowerEdge ${ }^{\text {TM }}$ Power Amplifier Module

## General Description

The RMPA0959 power amplifier module（PAM）is designed for cellular band AMPS，CDMA and CDMA2000－1X applications．The 2 stage PAM is internally matched to $50 \Omega$ to minimize the use of external components and features a low－power mode to reduce standby current and DC power consumption during peak phone usage．High power－added efficiency and excellent linearity are achieved using our Heterojunction Bipolar Transistor（HBT）process．

## Features

－Single positive－supply operation with low power and shutdown modes
－39\％CDMA efficiency at＋28dBm average output power
－ $53 \%$ AMPS mode efficiency at +31 dBm output power
－Compact LCC package（ $4.0 \times 4.0 \times 1.5 \mathrm{~mm}$ ）
－Internally matched to $50 \Omega$ and DC blocked RF input／ output
－Meets CDMA2000－1XRTT performance requirements

Device

## Functional Block Diagram

| Absolute Ratings ${ }^{1}$ |  |  |  |
| :--- | :--- | :---: | :---: |
| Symbol | Parameter | Ratings | Units |
| Vcc1, Vcc2 | Supply Voltages | 5.0 | V |
| Vref | Reference Voltage | 2.6 to 3.5 | V |
| Vmode | Power Control Voltage | 3.5 | V |
| Pin | RF Input Power | +10 | dBm |
| Tstg | Storage Temperature | -55 to +150 | ${ }^{\circ} \mathrm{C}$ |

Notes:
1: No permanent damage with one parameter set at extreme limit. Other parameters set to typical values.

## Electrical Characteristics ${ }^{1}$

| Symbol | Parameter | Min | Typ | Max | Units | Comments |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  |  |  | -57 |  | dBc | Po $=+16 \mathrm{dBm} ; \mathrm{Vmode} \geq 2.0 \mathrm{~V}$ |
| ACPR2 | $\pm 1.98 \mathrm{MHz}$ Offset |  | -60 |  | dBc | $\mathrm{Po}=+28 \mathrm{dBm} ; \mathrm{Vmode}=0 \mathrm{~V}$ |
|  |  |  | -70 |  | dBc | Po $=+16 \mathrm{dBm} ; \mathrm{Vmode} \geq 2.0 \mathrm{~V}$ |

## AMPS Operation

| Gp | Power Gain | 26 | 27.5 |  |  | $P o=+31 \mathrm{dBm}$ |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| PAEa | Power-Added Efficiency (analog) |  | 53 |  | $\%$ | $\mathrm{Po}=+31 \mathrm{dBm}$ |

General Characteristics

| VSWR | Input Impedance |  | $2.0: 1$ | $2.5: 1$ |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: |
| NF | Noise Figure |  | 4 |  | dB |  |
| Rx No | Receive Band Noise Power |  | -134 |  | $\mathrm{dBm} / \mathrm{Hz}$ | $\mathrm{Po} \leq+28 \mathrm{dBm} ; 869$ to 894 MHz |
| 2fo-5fo | Harmonic Suppression ${ }^{3}$ |  |  | -30 | dBc | $\mathrm{Po} \leq+28 \mathrm{dBm}$ |
| S | Spurious Outputs ${ }^{2,3}$ |  |  | -60 | dBc | Load VSWR $\leq 5.0: 1$ |
|  | Ruggedness w/ Load Mismatch ${ }^{3}$ |  |  | $10: 1$ |  | No permanent damage. |
| Tc | Case Operating Temperature $^{2}$ | -30 |  | 85 | ${ }^{\circ} \mathrm{C}$ |  |

DC Characteristics

| Iccq | Quiescent Current |  | 62 |  | mA | Vmode $\geq 2.0 \mathrm{~V}$ |
| :---: | :--- | :---: | :---: | :---: | :---: | :--- |
| Iref | Reference Current |  | 5 | 8 | mA | Po $\leq+28 \mathrm{dBm}$ |
| Icc(off) | Shutdown Leakage Current |  | $<1$ | 5 | uA | No applied RF signal. |

Notes:

1. All parameters met at $\mathrm{Tc}=+25^{\circ} \mathrm{C}, \mathrm{Vcc}=+3.4 \mathrm{~V}, \mathrm{Vref}=2.85 \mathrm{~V}$ and load $\mathrm{VSWR} \leq 1.2: 1$, unless otherwise noted
2. All phase angles.
3. Guaranteed by design.

## Recommended Operating Conditions

| Symbol | Parameter | Min | Typical | Max | Units |
| :---: | :--- | :---: | :---: | :---: | :---: |
| f | Operating Frequency | 824 |  | 849 | MHz |
| Vcc1, Vcc2 | Supply Voltage | 3.0 | 3.4 | 4.2 | V |
| Vref | Reference Voltage | (operating) <br> (shutdown) | 2.7 | 2.85 | 3.1 |
| Vmode | Bias Control Voltage | (low-power) <br> (high-power) | 0 |  | V |
|  |  | 1.8 | 2.0 | 3.0 | V |
| Pout | Linear Output Power | (high-power) <br> (low-power) |  |  | V |
|  |  |  |  | V |  |
| Tc | Case Operating Temperature | -30 |  | +16 | dBm |

## Typical Characteristics

RMPA0959 Cellular 4x4 PAM, Pout = 28dBm, IS95 mod.

RMPA0959 Cellular 4x4 PAM, Pout $=31 \mathrm{dBm}$, AMPS Mode

Cellular $4 \times 4$ PAM, Pout $=16 \mathrm{dBm}$, 1595 mod

Typical Characteristics (Continued)

## Efficiency Improvement Applications

In addition to high-power/low-power bias modes, the efficiency of the PA module can be significantly increased at backed-off RF power levels by dynamically varying the supply voltage (Vcc) applied to the amplifier. Since mobile handsets and power amplifiers frequently operate at 10-20 dB back-off, or more, from maximum rated linear power, battery life is highly dependent on the DC power consumed at antenna power levels in the range of 0 to +16 dBm . The reduced demand on transmitted RF power allows the PA supply voltage to be reduced for improved efficiency, while still meeting linearity requirements for CDMA modulation with excellent margin. High-efficiency DC-DC converters are now available to implement switched-voltage operation.

RMPA0959

RMPA0959

The following charts show measured performance of the PA module in low-power mode (Vmode $=+2.0 \mathrm{~V}$ ) at +16 dBm output power and over a range of supply voltages from 3.4V nominal down to 1.2 V . Power-added efficiency is more than doubled from 9.5 percent to nearly 25 percent ( $\mathrm{Vcc}=1.2 \mathrm{~V}$ ) while maintaining a typical ACPR1 of -52 dBc and ACPR2 of less than -61 dBc .

Operation at even lower levels of Vcc supply voltage are possible with a further restriction on the maximum RF output power. The PA module can be biased at a supply voltage of as low as 0.7 V with an efficiency as high as $10-$ 12 percent at +8 dBm output power. Excellent signal linearity is still maintained even under this low supply voltage condition.

## DC Turn on Sequence:

1) $\mathrm{Vcc1}=\mathrm{Vcc} 2=3.4 \mathrm{~V}$ (typical)
2) $\mathrm{Vref}=2.85 \mathrm{~V}$ (typical)
3) High-Power: Vmode $=0 \mathrm{~V}$ (Pout > 16dBm) Low-Power: Vmode $=2.0 \mathrm{~V}($ Pout $<16 \mathrm{dBm})$

## Evaluation Board Schematic

## Application Information

## CAUTION: THIS IS AN ESD SENSITIVE DEVICE

Precautions to Avoid Permanent Device Damage:

- Cleanliness: Observe proper handling procedures to ensure clean devices and PCBs. Devices should remain in their original packaging until component placement to ensure no contamination or damage to RF, DC \& ground contact areas.
- Device Cleaning: Standard board cleaning techniques should not present device problems provided that the boards are properly dried to remove solvents or water residues.
- Static Sensitivity: Follow ESD precautions to protect against ESD damage:
- A properly grounded static-dissipative surface on which to place devices.
- Static-dissipative floor or mat.
- A properly grounded conductive wrist strap for each person to wear while handling devices.
- General Handling: Handle the package on the top with a vacuum collet or along the edges with a sharp pair of bent tweezers. Avoiding damaging the RF, DC, \& ground contacts on the package bottom. Do not apply excessive pressure to the top of the lid.
- Device Storage: Devices are supplied in heat-sealed, moisture-barrier bags. In this condition, devices are protected and require no special storage conditions. Once the sealed bag has been opened, devices should be stored in a dry nitrogen environment.

## Device Usage:

Fairchild recommends the following procedures prior to assembly.

- Dry-bake devices at $125^{\circ} \mathrm{C}$ for 24 hours minimum. Note: The shipping trays cannot withstand $125^{\circ} \mathrm{C}$ baking temperature.
- Assemble the dry-baked devices within 7 days of removal from the oven.
- During the 7-day period, the devices must be stored in an environment of less than $60 \%$ relative humidity and a maximum temperature of $30^{\circ} \mathrm{C}$
- If the 7-day period or the environmental conditions have been exceeded, then the dry-bake procedure must be repeated.

Solder Materials \& Temperature Profile: Reflow soldering is the preferred method of SMT attachment. Hand soldering is not recommended.

## - Reflow Profile

- Ramp-up: During this stage the solvents are evaporated from the solder paste. Care should be taken to prevent rapid oxidation (or paste slump) and solder bursts caused by violent solvent out-gassing. A typical heating rate is $1-2^{\circ} \mathrm{C} / \mathrm{sec}$.
- Pre-heat/soak: The soak temperature stage serves two purposes; the flux is activated and the board and devices achieve a uniform temperature. The recommended soak condition is: $120-150$ seconds at $150^{\circ} \mathrm{C}$.
- Reflow Zone: If the temperature is too high, then devices may be damaged by mechanical stress due to thermal mismatch or there may be problems due to excessive solder oxidation. Excessive time at temperature can enhance the formation of intermetallic compounds at the lead/board interface and may lead to early mechanical failure of the joint. Reflow must occur prior to the flux being completely driven off. The duration of peak reflow temperature should not exceed 10 seconds. Maximum soldering temperatures should be in the range $215-220^{\circ} \mathrm{C}$, with a maximum limit of $225^{\circ} \mathrm{C}$.
- Cooling Zone: Steep thermal gradients may give rise to excessive thermal shock. However, rapid cooling promotes a finer grain structure and a more crackresistant solder joint. The illustration below indicates the recommended soldering profile.

## Solder Joint Characteristics:

Proper operation of this device depends on a reliable voidfree attachment of the heatsink to the PWB. The solder joint should be $95 \%$ void-free and be a consistent thickness.

## Rework Considerations:

Rework of a device attached to a board is limited to reflow of the solder with a heat gun. The device should not be subjected to more than $225^{\circ} \mathrm{C}$ and reflow solder in the molten state for more than 5 seconds. No more than 2 rework operations should be performed.

Figure 1. Recommended Solder Reflow Profile
