## MC14521B

## 24-Stage Frequency Divider

The MC14521B consists of a chain of 24 flip-flops with an input circuit that allows three modes of operation. The input will function as a crystal oscillator, an RC oscillator, or as an input buffer for an external oscillator. Each flip-flop divides the frequency of the previous flip-flop by two, consequently this part will count up to $2^{24}=$ $16,777,216$. The count advances on the negative going edge of the clock. The outputs of the last seven-stages are available for added flexibility.

- All Stages are Resettable
- Reset Disables the RC Oscillator for Low Standby Power Drain
- RC and Crystal Oscillator Outputs Are Capable of Driving External Loads
- Test Mode to Reduce Test Time
- $\mathrm{V}_{\mathrm{DD}}{ }^{\prime}$ and $\mathrm{V}_{\mathrm{SS}}{ }^{\prime}$ Pins Brought Out on Crystal Oscillator Inverter to Allow the Connection of External Resistors for Low-Power Operation
- Supply Voltage Range $=3.0 \mathrm{Vdc}$ to 18 Vdc
- Capable of Driving Two Low-power TTL Loads or One Low-power Schottky TTL Load over the Rated Temperature Range.

MAXIMUM RATINGS (Voltages Referenced to $\mathrm{V}_{\mathrm{SS}}$ ) (Note 2.)

| Symbol | Parameter | Value | Unit |
| :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{DD}}$ | DC Supply Voltage Range | -0.5 to +18.0 | V |
| $\mathrm{~V}_{\text {in }}, \mathrm{V}_{\text {out }}$ | Input or Output Voltage Range <br> (DC or Transient) | -0.5 to $\mathrm{V}_{\mathrm{DD}}+0.5$ | V |
| $\mathrm{I}_{\text {in }}, \mathrm{I}_{\text {out }}$ | Input or Output Current <br> (DC or Transient) per Pin | $\pm 10$ | mA |
| $\mathrm{P}_{\mathrm{D}}$ | Power Dissipation, <br> per Package (Note 3.) | 500 | mW |
| $\mathrm{~T}_{\mathrm{A}}$ | Ambient Temperature Range | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage Temperature Range <br> $\mathrm{T}_{\mathrm{L}}$Lead Temperature <br> (8-Second Soldering) | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |

2. Maximum Ratings are those values beyond which damage to the device may occur.
3. Temperature Derating:

Plastic "P and D/DW" Packages: - $7.0 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ From $65^{\circ} \mathrm{C}$ To $125^{\circ} \mathrm{C}$
This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, $\mathrm{V}_{\text {in }}$ and $\mathrm{V}_{\text {out }}$ should be constrained to the range $\mathrm{V}_{\mathrm{SS}} \leq\left(\mathrm{V}_{\text {in }}\right.$ or $\left.\mathrm{V}_{\text {out }}\right) \leq \mathrm{V}_{\mathrm{DD}}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either $\mathrm{V}_{\mathrm{SS}}$ or $\mathrm{V}_{\mathrm{DD}}$ ). Unused outputs must be left open.

Figure 8. Functional Test Circuit

FUNCTIONAL TEST SEQUENCE

A test function (see Figure 8) has been included for the reduction of test time required to exercise all 24 counter stages. This test function divides the counter into three 8-stage sections, and 255 counts are loaded in each of the 8-stage sections in parallel. All flip-flops are now at a logic " 1 ". The counter is now returned to the normal 24-stages in series configuration. One more pulse is entered into Input 2 (ln 2) which will cause the counter to ripple from an all "1" state to an all "0" state.
