MP3/USB 2.0 High Speed Swi Shutdown

1-888-NTERSIT

FN6815
Rev 0.00
Dec 11, 2008

The Intersil ISL54215 dual SPDT (Single Pole/Double Throw) switch combines low distortion audio and accurate USB 2.0 high speed data ( 480 Mbps ) signal switching in the same low voltage device. When operated with a 2.5 V to 5.0 V single supply, this analog switch allows audio signal swings below ground, allowing for the use of a common USB and audio headphone connector in Personal Media Players and other portable battery powered devices.

The ISL54215 logic control pins are 1.8 V compatible, which allows for control via a standard microcontroller.

The ISL54215 has an audio enable control pin to open all switches and put the part in a low power state. In this state, the device draws typically 1 nA of current.

The ISL54215 is available in a small 10 Ld 2.1 mmx 1.6 mm ultra-thin $\mu$ TQFN package. It operates over a temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## Features

- High Speed (480Mbps) and Full Speed (12Mbps) Signaling Capability per USB 2.0
- Low Distortion Negative Signal Capability
- Low Power Shutdown State
- Low Distortion Headphone Audio Signals
- THD+N at 1 mW into $32 \Omega$ Load . <0.013\%
- Crosstalk (100kHz). . . . . . . . . . . . . . . . . . . . . . . . . . -95dB
- OFF-Isolation (100kHz) . . . . . . . . . . . . . . . . . . . . . . 95dB
- Single Supply Operation ( $\mathrm{V}_{\mathrm{DD}}$ ) . . . . . . . . . . . 2.5 V to 5.0 V
- -3dB Bandwidth USB Switch . . . . . . . . . . . . . . . . . 736MHz
- Available in $\mu$ TQFN Package
- Compliant with USB 2.0 Short Circuit Requirements Without Additional External Components
- Pb-Free (RoHS Compliant)

## Applications

- MP3 and other Personal Media Players
- Cellular/Mobile Phones
- PDAs
- Audio/USB Switching

2. These Intersil Pb -free plastic packaged products employ special Pb free material sets; molding compounds/die attach materials and NiPdAu plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations. Intersil Pb -free products are MSL classified at Pb -free peak reflow temperatures that meet or exceed the Pb -free requirements of IPC/JEDEC J STD-020.

## Thermal Information

## Operating Conditions

Temperature Range . . . . . . . . . . . . . . . . . . . . . . . . . $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:
3. Signals on D+, D-, L, R, COM-, COM+, CTRL and IN exceeding $V_{D D}$ or GND by specified amount are clamped. Limit current to maximum current ratings.
4. $\theta_{\mathrm{JA}}$ is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief TB379.
5. For $\theta_{\mathrm{JC}}$, the "case temp" location is the center of the exposed metal pad on the package underside.

## NOTES:

6. $\mathrm{V}_{\text {logic }}=$ Input voltage to perform proper function.
7. The algebraic convention, whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.
8. Parameters with MIN and/or MAX limits are $100 \%$ tested at $+25^{\circ} \mathrm{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.
9. Flatness is defined as the difference between maximum and minimum value of ON-resistance over the specified analog signal range.
10. Limits established by characterization and are not production tested.
11. $r_{\mathrm{ON}}$ matching between channels is calculated by subtracting the channel with the highest max ron value from the channel with lowest max ron value, between $L$ and $R$ or between $D+$ and $D$-.

## Test Circuits and Waveforms

Logic input waveform is inverted for switches that have the opposite logic sense.

Repeat test for all switches. $C_{L}$ includes fixture and stray capacitance.

$$

## Typical Application Block Diagrams

FIGURE 8. LOGIC CONTROL VIA MICROPROCESSOR

FIGURE 9. LOGIC CONTROL VIA VBus VOLTAGE FROM COMPUTER OR USB HUB

## Detailed Description

The ISL54215 device is a dual single pole/double throw (SPDT) analog switch that operates from a single DC power supply in the range of 2.5 V to 5.0 V . It was designed to function as a dual 2 to 1 multiplexer to select between USB differential data signals and audio $L$ and $R$ stereo signals. It comes in tiny $\mu$ TQFN package for use in MP3 players, PDAs, cellular phones and other personal media players.

The part consists of two $2.5 \Omega$ audio switches and two $5 \Omega$ USB switches. The audio switches can accept signals that swing below ground. They were designed to pass audio left and right stereo signals, that are ground referenced, with minimal distortion. The USB switches were designed to pass highspeed USB differential data signals with minimal edge and phase distortion.

The ISL54215 was specifically designed for MP3 players, personal media players and cellular phone applications that need to combine the audio headphone jack and the USB data
connector into a single shared connector, thereby saving space and component cost. "Typical Application Block Diagrams" on page 8 of this functionality are shown in Figures 8 and 9.

The ISL54215 has a single logic control pin (IN) that selects between the audio switches and the USB switches. This pin can be driven Low or High to switch between the audio CODEC drivers and USB transceiver of the MP3 player or cellular phone. The ISL54215 also contains a logic control pin (CTRL) that when driven Low while IN is Low, opens all switches and puts the part into a low power state, drawing typically 1 nA of $\mathrm{I}_{\mathrm{DD}}$ current.

Detailed descriptions of the two types of switches are provided in the following sections.

## Audio Switches

The two audio switches ( $\mathrm{L}, \mathrm{R}$ ) are $2.5 \Omega$ switches that can pass signals that swing below ground by as much as 1.5 V . They were designed to pass ground reference stereo signals with minimal insertion loss and very low distortion over a $\pm 1 \mathrm{~V}$ signal range.
Crosstalk between the audio channels is -100 dB over the audio band. Crosstalk between the audio channel and USB channel is -95 dB at 100 kHz . These switches have excellent OFF-isolation, 115 dB , over the audio band with a $32 \Omega$ load.

Over a signal range of $\pm 1 \mathrm{~V}\left(0.707 \mathrm{~V}_{\mathrm{RMS}}\right)$ with $\mathrm{V}_{\mathrm{DD}}>2.7 \mathrm{~V}$, these switches have an extremely low ron resistance variation. They can pass ground referenced audio signals with very low distortion ( $<0.05 \%$ THD +N ) when delivering 15.6 mW into a $32 \Omega$ headphone speaker load. See Figures 10 through 13 for THD+N performance curves.
These switches are bi-directional switches. In typical applications, the audio drivers would be connected at the $L$ and $R$ side of the switch (pins 6 and 7) and the speaker loads would be connected at the COM side of the switch (pins 3 and 4).

The audio switches are active (turned ON) whenever the IN voltage is $\leq 0.5 \mathrm{~V}$ or floating and the CTRL voltage $\geq$ to 1.4 V .

## USB Switches

The two USB switches (D+, D-) are bidirectional switches that can pass rail-to-rail signals. When powered with a 3.3 V supply, these switches have a nominal ron of $5 \Omega$ over the signal range of 0 V to 400 mV with a $\mathrm{r}_{\mathrm{ON}}$ flatness of $0.45 \Omega$. The ron matching between the $D+$ and $D$ - switches over this signal range is only $0.05 \Omega$ ensuring minimal impact by the switches to USB high speed signal transitions. As the signal level increases, the ron resistance increases. At a signal level of 3.3 V , the switch resistance is nominally $25 \Omega$.

The USB switches were specifically designed to pass USB 2.0 high-speed ( 480 Mbps ) differential signals typically in the range of 0 V to 400 mV . They have low capacitance and high bandwidth to pass the USB high-speed signals with minimum
edge and phase distortion to meet USB 2.0 high speed signal quality specifications. See Figure 14.
The USB switches can also pass USB full-speed signals (12Mbps) with minimal distortion and meet all the USB requirements for USB 2.0 full-speed signaling. See Figure 15 for Full-speed Eye Pattern taken with switch in the signal path.

The maximum signal range for the USB switches is from -1.5 V to $\mathrm{V}_{\mathrm{DD}}$. The signal voltage at D - and $\mathrm{D}+$ should not be allowed to exceed the $V_{D D}$ voltage rail or go below ground by more than -1.5 V .

The USB switches are active (turned ON) whenever the IN voltage is $\geq$ to 1.4 V .

## ISL54215 Operation

The following will discuss using the ISL54215 in the "Typical Application Block Diagrams" on page 8 shown in Figures 8 and 9.

## $V_{D D}$ SUPPLY

The DC power supply connected at VDD (pin 1) provides the required bias voltage for proper switch operation. The part can operate with a supply voltage in the range of 2.5 V to 5.0 V .

In a typical USB/Audio application for portable battery powered devices, the $\mathrm{V}_{\mathrm{DD}}$ voltage will come from a battery or an LDO and be in the range of 2.7 V to 3.6 V . For best possible USB fullspeed operation (12Mbps), it is recommended that the $V_{D D}$ voltage be $\geq 2.5 \mathrm{~V}$ in order to get a USB data signal level above 2.5 V .

## LOGIC CONTROL

The state of the ISL54215 device is determined by the voltage at the IN pin (pin 2) and the CTRL pin (pin 10). These logic pins are 1.8 V logic compatible when $\mathrm{V}_{\mathrm{DD}}$ is in the range of 2.7 V to 3.6 V and can be controlled by a standard microprocessor. The part has three states or modes of operation. The Audio Mode, USB Mode and the Low Power Mode. Refer to the "Truth Table" on page 2.

The IN and CTRL pins are internally pulled low through a $4 \mathrm{M} \Omega$ resistor to ground and can be left floating or tri-stated by the $\mu$ processor. The CTRL control pin is only active when IN is logic " 0 ".

## Logic control voltage levels:

$\mathrm{IN}=$ Logic " 0 " (Low) when $\mathrm{V}_{\mathrm{IN}} \leq 0.5 \mathrm{~V}$ or Floating.
$\mathrm{IN}=$ Logic "1" (High) when $\mathrm{V}_{\mathrm{IN}} \geq 1.4 \mathrm{~V}$
CTRL = Logic " 0 " (Low) when $\leq 0.5 \mathrm{~V}$ or Floating.
CTRL = Logic "1" (High) when $\geq 1.4 \mathrm{~V}$

## Audio Mode

If the IN pin = Logic " 0 " and CTRL pin = Logic " 1 ", the part will be in the Audio mode. In Audio mode, the $L$ (left) and $R$ (right) $2.5 \Omega$ audio switches are $O N$ and the $D$ - and $D+5 \Omega$ switches are OFF (high impedance).

When nothing is plugged into the common connector or a headphone is plugged into the common connector, the microprocessor will sense that there is no voltage at the $V_{B U S}$ pin of the connector and will drive and hold the IN control pin of the ISL54215 low. As long as CTRL = Logic "1," the ISL54215 part will be in the audio mode and the audio drivers of the media player can drive the headphones and play music.

## USB Mode

If the IN pin = Logic " 1 " and the CTRL pin = Logic "0" or Logic " 1 ", the part will go into USB mode. In USB mode, the D- and $D+5 \Omega$ switches are $O N$ and the $L$ and $R 2.5 \Omega$ audio switches are OFF (high impedance).

When a USB cable from a computer or USB hub is connected at the common connector, the $\mu$ processor will sense the presence of the $5 \mathrm{~V} \mathrm{~V}_{\text {BUS }}$ and drive the IN pin voltage high. The ISL54215 part will go into the USB mode. In USB mode, the computer or USB hub transceiver and the MP3 player or cell phone USB transceiver are connected and digital data will be able to be transmitted back and forth.

When the USB cable is disconnected, the $\mu$ processor will sense that the $5 \mathrm{~V} \mathrm{~V}_{\text {BUS }}$ voltage is no longer connected and will drive the IN pin low and put the part back into the Audio or Low Power Mode.

## Low Power Mode

If the IN pin = Logic " 0 " and CTRL pin = Logic " 0 ", the part will be in the Low Power mode. In the Low Power mode, the audio switches and the USB switches are OFF (high impedance). In this state, the device draws typically 1 nA of current.

In Low Power mode, the OFF-isolation and crosstalk between switch cells is minimal for negative swinging signals. Care should be taken to avoid negative swinging signals in this mode of operation. In typical applications, the Low Power state will be applied to the ISL54215 part when the portable media
player is in its sleep or hibernate mode to conserve battery power. In the sleep mode, no audio or USB signals are applied to the part.

## USING THE COMPUTER VBus VOLTAGE TO DRIVE THE "IN" PIN

Rather than using a microprocessor to control the IN logic pin, one can directly drive the IN pin using the $5 \mathrm{~V} \mathrm{~V}_{\text {BUS }}$ voltage from the computer or USB hub. See the Application Block Diagram, Figure 9.

When a headphone or nothing is connected at the common connector, the internal $4 \mathrm{M} \Omega$ pull-down will pull the IN pin low, putting the ISL54215 in the Audio or Low Power mode, depending on the condition of the CTRL pin.

When a USB cable is connected at the common connector, the voltage at the IN pin will be driven to 5 V and the part will automatically go into the USB mode.

When the USB cable is disconnected from the common connector, the voltage at the IN pin will be pulled low by the pull-down resistor and return to the Audio or Low Power mode, depending on the condition of the CTRL pin.

Note: The ISL54215 contains an internal diode between the IN pin and VDD pin. Whenever the IN voltage is greater than the $\mathrm{V}_{\mathrm{DD}}$ voltage by more than 0.7 V , current will flow through this diode into the $V_{D D}$ power supply bus. An external series resistor in the range of $100 \mathrm{k} \Omega$ to $500 \mathrm{k} \Omega$ is required at the IN logic pin to limit the current when driving it with the $V_{B U S}$ voltage. This allows the $\mathrm{V}_{\text {BUS }}$ voltage from a computer or USB hub ( 4.4 V to 5.25 V ) to drive the IN pin while the $\mathrm{V}_{\mathrm{DD}}$ voltage is in the range of 2.5 V to 3.6 V . A $500 \mathrm{k} \Omega$ resistor will limit the current to $2.76 \mu \mathrm{~A}$ and still allow the IN logic voltage to go to around 3.67 V , which is will above the required $\mathrm{V}_{\text {IN }} \mathrm{H}$ level of 1.4 V . A smaller series resistor can be used but more current will flow.
