

## xCORE-200 XU/XUF USB

A new generation of high performance USB-enabled multicore microcontrollers

### FEATURES

**Multicore compute** with between 1000MIPS (8 core) and 4000MIPS (32 core) performance.

**Hardware Response<sup>™</sup> ports** provide flexible, high-performance configurable I/O capability.

**Integrated USB 2.0 PHY** for high- and full-speed host and device operation.

**Up to 1024KB on-board memory** for demanding applications.

**Embedded flash option** – up to 2048KB on-board.

**Free software library support** to implement your exact mix of peripherals.

**Easy to use** with our free xTIMEcomposer Studio<sup>™</sup> tools.

The xCORE-200<sup>™</sup> USB family of devices (XU and XUF) extends the popular xCORE<sup>™</sup> architecture to provide increased performance, memory footprint and flexibility for the most demanding applications.

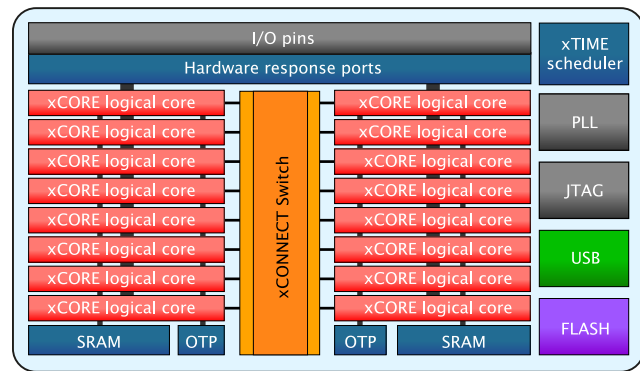

xCORE-200 XU/XUF integrates up to two USB 2.0 PHYs (host or device) and implements a dual-issue processor pipeline to boost peak compute performance to 4000MIPS and 2000MMACS.

Up to 1024KB on-chip SRAM memory is available. Each member of the xCORE-200 family has an embedded flash option for applications where additional security is required.

The flexible Hardware Response ports are bonded out to I/O pins as 1bit, 4bit, 8bit, 16bit and 32bit ports, and provide support for serialized and buffered data transfer. Up to 208 general purpose I/O are available for user configuration.

xCORE-200 is supported by the advanced XMOS xTIMEcomposer Studio<sup>™</sup> development environment, and a wide range of microcontroller and application libraries are freely downloadable from [www.xmos.com](http://www.xmos.com)

Unlike conventional microcontrollers, xCORE-200 multicore microcontrollers execute multiple real-time tasks simultaneously. The xCORE-200 XU/XUF family includes devices with 8, 10, 12, 16, 24 and 32 cores. Each logical core can execute computational code, advanced DSP code, control software (including logic decisions and executing a state machine) or drive and sample data on the I/O ports.

xCORE-200™ XUF216

The devices include xTIME scheduling hardware that performs functions similar to those of an RTOS, and hardware that connects the cores directly to I/O pins, ensuring fast processing and extremely low latency. The xTIME scheduler eliminates the use of interrupts and ensures deterministic operation.

The on-chip SRAM can be accessed in a single cycle, reducing shared memory requirements by passing data directly between tasks executing on logical cores. Similarly the xCONNECT switch is a high-speed network allowing all cores to communicate with each other.

xCORE-200 multicore microcontrollers include an area of one-time programmable memory with AES support to allow the implementation of secure boot functionality.

## ORDERING INFORMATION

xCORE-200 XU/XUF devices are available in a range of resource densities, packages, performance and temperature grades depending on your needs.

Family	Cores	RAM (KB)	Flash (KB)	USB PHYs	Package [GPIOs]
